

100%
ARTIFICIAL SNOW

NEVEPLAST: An innovative concept

Neveplast produces artificial slopes with unique features for Nordic skiing allowing the practise of this sport regardless of climatic conditions and without the use of water all year round. Neveplast is the only artificial surface in the world certified with the same slipperiness as real snow.

It is an innovative product, which aims to integrate with snow when there is little of it or substitute it allowing skiing throughout the year both in cities and in the mountains. Neveplast is able to simulate the conditions and characteristics of the ski slopes, from the easiest ones to those for skilled skiers only, for training and strengthening, and to follow beginners from their “first steps” to the perfection of their style.

NP50 FREE TECHNIQUE

The surface is composed of small sized modules that are assembled together through a quick coupling system that allows high flexibility and perfect adhesion of the product to the ground. The slipperiness, scientifically certified in a research laboratory, is the same as real snow, allowing the reproduction of athletic movements. The special conical shape of the bristles along with their consistency and stiffness allow excellent sliding performance both with the ski flat and also when on the edge, providing very good side grip. This results in easy skiing with the same sensation as skiing on compact snow.

NEVEPLAST NP50 CLASSIC TECHNIQUE

The slope consists of a series of modules made of an ABS shell with two inside lanes of Neveplast material. The dimensions of the lanes are taken from the official FIS race format. The coupling system of the modules is fast and easy. Alongside the lanes there is a 30 cm. side profile which ensures the perfect cleaning of the slope. The ski poles, during the pushing phase touch the plastic side profile and not the ground. This guarantees best performance during the pushing phase by not allowing the ski poles to slip. Inside the lanes the Neveplast Np50 material is inserted ensuring very good performances in slipperiness and side grip.

EQUIPMENT

On Neveplast Np50 you can use the same equipment as that used on snow. The high level of slipperiness and the special mix ensure that the equipment is not subject to any wear, notwithstanding regular and continuous use. These characteristics make Neveplast Np50 very advantageous to all those wishing to develop an installation, guaranteeing very low management costs. For skiing on Neveplast Np50 in the Classic Technique it is recommend the use of squamate skis.

SLIPPERINESS

This technical feature is influenced by the material used and the design of the bristles. This is the reason why we use mixes of plastic materials with percentages of dry lubricants guaranteeing the excellent slipperiness. This feature is further improved by the use of sliding agents of our own production.

For fun and sport in every place and weather condition, Neveplast is also: Np30 & Tubby
